Introduction

This study describes crop-share and cash leasing arrangements in Montana for calendar year 2013 by surveying land owners, who own dry and irrigated cropland and grazing land. A dataset containing names and address of all land owners in Montana was provided by the Department of Revenue's Property Assessment Division. A sample of 880 land owners selected from this population completed the telephone implemented by the Bureau of Business and Economic Research at the University of Montana. Faculty members in the Department of Agricultural Economics and Economics at Montana State University were responsible for developing the questionnaire; conducting personal interviews with landlords, tenants, and real estate agents; and, analyzing these data.

The next four sections review the methods, report the results, discuss the findings in the summary and conclusions section, and consider the limitations to this study.

Methods

Data Collection

The interviewers at the Bureau of Business and Economic Research (BBER) at the University of Montana collected the primary data for this study. The BBER was given a list of land owners from the Department of Revenue. Using a telephone number look-up service, the BBER called 7,338 telephone numbers to determine if the respondent owned agricultural land in Montana; and if the respondent leased agricultural land to farmers and ranchers. These 7,338 telephone numbers yielded 3,007 respondents with agricultural land; however, only 880 of the respondents had leased land. Table 1 reports the case disposition for this study. Based on the American Association for Public Opinion Research's calculation methods, the response rate was 47 percent.

The most substantial challenge in this data collection effort was soliciting answers to questions involving amounts of money (such as cash lease rates), cattle numbers, and crop yields. Respondents were able to answer the share lease percentage questions (for instance, what was the typical crop-share for dry crop land last year); hence, there was a high rate of usable observations (84% dry crop land, 76% irrigated crop land, and 59% grazing land) for share leases. Respondents either had a difficult time answering cash lease questions or they weren't interested in reporting cash lease rates to the interviewer; hence there was a low rate of usable observations (35% dry crop land, 28% irrigated crop land, 31% grazing land, acre basis, and 23% grazing land, AUM basis) for cash leases. Missing values for nonresponse or refusals was positively correlated with age.

Table 1 Response rates for the sample

Case Disposition Description	N
Complete	880
Complete, no leased land	2,127
Refused	1,370
Broken interview	133
Unresolved appointment	76
Non-interview due to hearing or other disability	63
No answer	204
Answering machine	1,549
Owns no land	368
Duplicate telephone number	34
Non-working number	534
Total telephone numbers used	7,338
AAPOR Response Rate 1 (RR1)	47.0%
Screening rate (SR)	29.3%

RR1 = Complete + Complete, no leased land / Complete + Complete, no leased land + Refused + Broken interview + Unresolved appointment + Non-interview + No answer + Answering machine

SR = Complete / Complete + Complete, no leased land

Questionnaire

The questionnaire was divided into two sections: Section 1, which provided a leasing profile for each of the respondents; and Section 2, which provided a more in-depth profile of the leasing arrangement generating the most revenue or compensation for the land owner. Section 1 asked respondents how many acres were leased on share or cash arrangement for dry crop, irrigated crop, and grazing land; what was the typical share (percentage to the owner) or cash (money paid to the owner) lease; and, what expenses (except property taxes and liability insurance) were incurred by owner. Nearly all respondents, 860 of 880, answered Section 1 questions.

Section 2 asks respondents to provide substantially more detail on these lease arrangements. Respondents were asked the following for crop leases: (1) location of the property, (2) crop grown on the parcel of land, (3) acres in the field, (4) crop yield, (5) crop rotation, (6) gross value of the lease, (7) percent of the crop received (share leases only), (8)

percent of expenses paid for selected expense items (share leases only), (9) expenses paid for selected expense items (cash leases only), (10) years the tenant leases the land, (11) any blood relationship between the owner and tenant, (12) type of lease (written or verbal), and (13) market value of the land. Respondents were asked the following for grazing leases: (1) location of the property, (2) months of grazing covered under the arrangement, (3) acres in the pasture, (4) number of animal units, (5) gross value of the lease, (6) land owners share (share lease only), (7) percent of expenses paid for selected expense items (share lease only), (8) expenses paid for selected expense items (cash leases only), (9) years the tenant leases the land, (10) any blood relationship between the owner and tenant, (11) type of lease (written or verbal), and (12) market value of the land. Please see Appendix B for a copy of the questionnaire used in this study.

Analysis

The analysis for this study primarily used frequencies, means, medians, standard deviations, and 95% confidence intervals. The main body of the report discusses these statistical measures for complete observations (where the respondent answered both revenue and expense questions); and, all results are weighted by the number of acres in the lease.

The leasing questionnaire was based on similar land use studies conducted by the USDA’s National Agricultural Statistics Service, Iowa State University, Kansas State University, and North Central Farm Management Extension Committee. The questionnaire began with a summary section asking respondents about “typical” leasing arrangements for each type of lease; and ended with a section asking detailed questions about leasing arrangements for the parcel of leased land generating the highest lease revenue.

Characteristics of the Sample

This section profiles leasing activity in Montana by asking respondents about their dry and irrigated crop and grazing land leases. Share and cash leases were identified for each type of land. The survey identified 1,081 leasing arrangements for the 879 respondents interviewed (Table 2). Nearly 60% of the respondents were over 64 years of age.

Table 2 Number of crop-share and cash leases by land type by respondent

Type of Land	Share	Cash
Dry crop	221	285
Irrigated crop	51	152
Grazing	22	350

Chart 1 shows the acreage distribution of share and cash leases by land type for this sample. The leases in this sample represent nearly 751,000 acres in Montana. Nearly half (46%) of the acres in this sample were cash leases for grazing, 24% were cash leases for dry land crops, 20% were share leases for dry land crops, the remaining 10% were for other leases. Dry crop leases were nearly evenly divided between share (49.3%) and cash (50.7%) leases, while both irrigated crop and grazing leases were primarily cash leases (Chart 2). The land owners in the sample had from one to four types of leases.

Chart 1 Percentage of lease agreements by land type

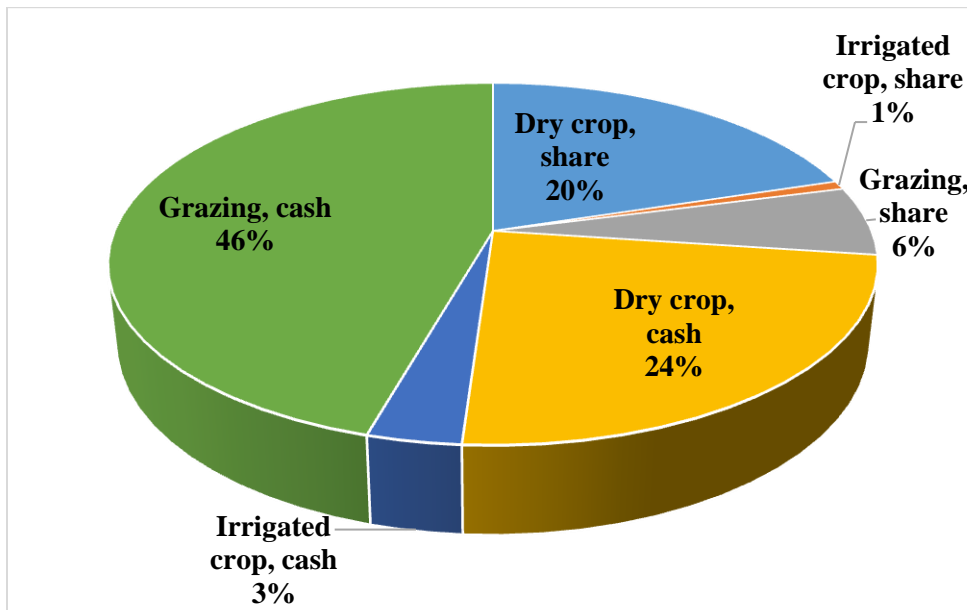

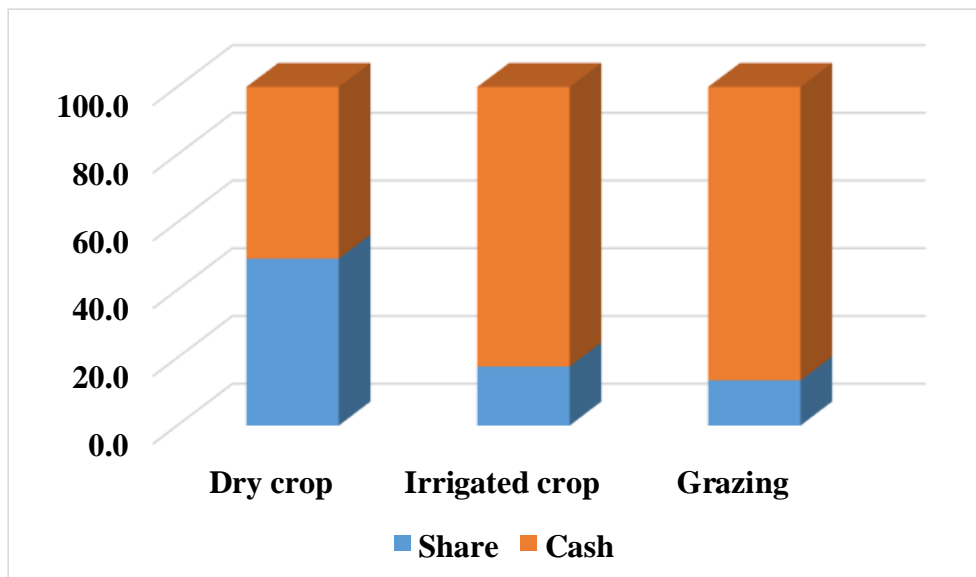

Chart 2 Percentage of share and cash lease arrangements by land type

A majority of the land owners held just one type of lease with the largest number of leases being grazing land cash (200), dry land cash (162) and dry land crop share (144) leases (see Table 3 for additional details). And finally, a majority of the observations were from the crop reporting districts 2 (Triangle), 3 (Northeast) and 5 (Central). Please see Table 4 for additional details.

Table 3 Distribution of leases held by land owners in the sample

Southcentral (CRD-8)	107	12.2
Southeast (CRD-9)	64	7.3

Results

The next six sections summarize the share and cash leases for each type of land (dry land crop, irrigated crop, and grazing land). All statistics reported in the next section are weighted by the number of acres in the lease, rather than the number of respondents. The tables report weighted frequencies, means, standard deviations, medians, and confidence intervals. In addition, these tables include only responses where the tenant's cash payment and expenses are reported. Given the substantial number of missing values for expenses, a significant number of tenants' cash payment observations are not used. Appendix A reports tenants' cash payment information, which includes the observations not used. All percentages and dollar amounts for dry and irrigated crop land are reported on a per acre basis, while percentages and dollar amounts for grazing land are reported on a per acre and per animal unit month (AUM) basis.

Dry crop land share arrangements

Share leasing arrangements comprised 46% of the acreage in dry crop land leases. Sixty percent of the dry crop land acres under a share lease paid the owner from 30 to 34% of the crop yield (Table 5). The mean and median crop share percentages were 34% and 33%, respectively. Based on the 186 respondents with dry crop land share leases answering the questionnaire, the 95% confidence interval suggests that the true mean is between 32% and 35%.

Typically, share lease arrangements require the land owner and tenant to share in the revenue and expenses. In this sample, two-thirds of the land owners shared in some expenses (Table 8 – column 1). Over 30% of these land owners shared in fertilizer, federal crop insurance and hail insurance expenses, while less than 25% shared in other expenses, including seed, pesticides, and other expenses.

Irrigated crop land share arrangements

Share leasing arrangements comprised 19% of the acreage in irrigated crop land leases. Over 50% of the irrigated crop land acres under a share lease paid the owner from 25 to 34% of the crop yield (Table 6). The mean and median crop share percentages were 38% and 33%,

respectively. Based on the 39 respondents with irrigated crop land share leases answering the questionnaire, the 95% confidence interval suggests that the true mean is between 33% and 43%.

In this sample, nearly two-thirds of the land owners shared in some expenses (Table 8 – column 2). Over 39% of these land owners shared in fertilizer and irrigation expenses, while less than 25% shared in other expenses, including building and fence maintenance, federal crop insurance, seed, and other expenses.

Grazing land share arrangements

Share leasing arrangements comprised 12% of the acreage in grazing land leases; however, only 13 grazing leases were reported in this sample. Over 75% of the grazing land acres under a shared lease paid the owner less than 45% of the revenue, while just under 20% paid the owner 50% or more of the revenue (Table 7). The mean and median share percentages were 41% and 30%, respectively. Based on the 13 respondents with grazing land share leases answering the questionnaire, the 95% confidence interval suggests that the true mean is between 27% and 56%. Given the small sample, these results should be used with caution.

In this sample, about 40% of the land owners shared in some livestock expenses (Table 9 – column 1). Over 25% of these land owners shared in building and fence maintenance and nearly 14% shared in veterinary supplies.

¹ Assumes all land taxes and liability insurance are paid by the owner

Dry crop land cash arrangements

Cash leasing arrangements comprised 54% of the acreage in dry crop land leases (Table 10). Over 60% of the dry crop land acres under cash leases paid the owner from \$20 to \$35 per acre. The mean and median revenue from cash leases were both \$26/acre. Based on the 99 respondents with dry crop land cash leases answering the questionnaire, the 95% confidence interval suggests that the true mean is between \$24/acre and \$29/acre.

Table 10 Tenant's cash payment on dry crop land

Median		26
Confidence Interval (95%), lower bound		24
Confidence Interval (95%), upper bound		29

Typically, cash lease arrangements do not require the land owner to share in the operating expenses. In this study, we assume that all property taxes and liability insurance are paid by the owner. In this sample of 99 owners who answered the revenue and expense questions, owners leasing 62% of the acreage paid no expenses (Table 11). The mean and median expense amounts were \$2/acre and \$0/acre, respectively. The 95% confidence interval suggests that the true mean is between \$1/acre and \$4s/acre.

Even though many respondents chose not to answer the revenue and expense value (dollar amount) questions, they did identify expenses they typically paid. In this sample of 285 owners, 20% of them paid some expenses (Table 8 – column 3). Over 14% of these land owners paid building and fence maintenance expenses, while less than 10% paid other operating expenses.

The net cash lease is estimated by subtracting revenue paid to the owner by the tenant from expense paid by the owner. The mean net cash lease is \$24/acre with the 95% confidence interval between \$21 and \$26/acre (Table 12).

Table 11 Owner's cash expenses on dry crop land

Expenses	Weighted	
	n (acres)	%

Median		25
Confidence interval (95%), lower bound		21
Confidence interval (95%),upper bound		26

Irrigated land cash arrangements

Cash leasing arrangements comprised 82% of the acreage in irrigated crop land leases. Over 60% of the irrigated crop land acres under cash leases paid the owner from \$50 to \$90 per acre (Table 13). The mean and median revenue from cash leases were both \$75/acre. Based on the 42 respondents with irrigated crop land cash leases answering the questionnaire, the 95% confidence interval suggests that the true mean is between \$68/acre and \$82/acre.

Table 13 Tenant's cash payment on irrigated crop land

Confidence Interval (95%), lower bound		68
Confidence Interval (95%), upper bound		82

In this sample of 42 owners who answered the revenue and expense questions, owners leasing 16% of the acreage paid no expenses (Table 14). The mean and median expense amounts were \$10/acre and \$2/acre, respectively. The 95% confidence interval suggests that the true mean is between \$6/acre and \$14/acre. The survey did not distinguish among gravity and sprinkler irrigation.

Even though many respondents chose not to answer the revenue and expense value (dollar amount) questions, they did identify expenses they typically paid. In this sample of 152 owners, 55% of them paid some expenses (Table 8 – column 3). Over 43% of these land owners paid irrigation expenses, 24% paid building and fence maintenance expenses, and less than 10% paid other operating expenses.

The net cash lease is estimated by subtracting revenue paid to the owner by the tenant from expense paid by the owner. The mean net cash lease is \$65/acre with the 95% confidence interval between \$58 and \$72/acre (Table 15).

Grazing land cash arrangements

Cash leasing arrangements comprised 88% of the acreage in grazing land leases. Grazing land lease information was collected on a per acre and per animal unit month basis. Tables 16 through 18 examine grazing land leases on a per acre basis. Grazing lease rates on a per acre basis were highly variable because no information was provided on the number of months of grazing, number of animal units, or quality of the grazing land. Over 72% of the grazing land acres under a cash lease paid the owner less than \$10/acre (Table 16). The mean and median revenue from cash leases were \$8/acre and \$4/acre, respectively. Based on the 109 respondents with grazing land cash leases answering the questionnaire, the 95% confidence interval suggests that the true mean is between \$7/acre and \$10/acre.

Table 16 Tenant's cash payment on grazing land, acre basis

Tenant's Cash Payment	Weighted

	130,403	100
Mean		8
Standard deviation		9
Median		4
Confidence Interval (95%), lower bound		7
Confidence Interval (95%), upper bound		10

In this sample of 109 owners who answered the revenue and expense questions, 37% paid no expenses (Table 17). The mean and median expense amounts were \$3/acre and \$1/acre, respectively. The 95% confidence interval suggests that the true mean is between \$2/acre and \$4/acre.

Even though many respondents chose not to answer the revenue and expense value (dollar amount) questions, they did identify expenses they typically paid. In this sample of 350 owners, 38.5% of them paid some expenses (Table 9 – column 2). Over 32% of these land owners paid building and fence maintenance expenses and about 13% paid livestock water expenses.

The net cash lease is estimated by subtracting revenue paid to the owner by the tenant from expense paid by the owner. The mean net cash lease is \$5/acre with the 95% confidence interval between \$4 and \$7/acre (Table 18).

Table 17 Owner's cash expenses on grazing land, acre basis

Tables 19 through 21 examine grazing land leases on an AUM basis. Grazing lease rates on a per AUM basis were less variable because more information was provided by the respondent, such as the number of months of grazing, and number of animal units. Over 50% of the grazing land cash leases paid the owner less than \$20/AUM (Table 19). The mean and median revenue from cash leases were \$21/AUM and \$19/AUM, respectively. Based on the 66 respondents with grazing land cash leases answering the questionnaire, the 95% confidence interval suggests that the true mean is between \$17/acre and \$25/acre.

Confidence Interval (95%), lower bound		17
Confidence Interval (95%), upper bound		25

In this sample of 66 owners who answered the revenue and expense questions, 54% paid no expenses (Table 20). The mean and median expense amounts were \$3/AUM and \$0/AUM, respectively. The 95% confidence interval suggests that the true mean is between \$2/AUM and \$4/AUM.

The net cash lease is estimated by subtracting revenue paid to the owner by the tenant from expense paid by the owner. The mean net cash lease is \$18/AUM with the 95% confidence interval between \$14 and \$22/AUM (Table 21).

Summary and Conclusions

NASS – Montana Office does not publish any information on crop or livestock share leases; however, they do publish crop and livestock cash leasing rates. The most recent rates were published in 2013 (cash rent values on per acre basis are for 2013 and grazing fees on AUM basis are for 2012). Table 22 summarizes the share arrangements for dry and irrigated crop land and grazing land. Clearly, traditional one-third – two-thirds crop share lease is still employed on dry and irrigated crop land in Montana. The 95% confidence interval for the dry land crop share estimate was between 32% and 35%, while the irrigated crop share estimate was between 33% and 43%. The grazing share estimate was much less precise with the 95% confidence interval between 27% and 56%.

Table 22 Share lease arrangement summary, land owners only

Land Type	Mean	Lower	Upper	Median
		Bound	Bound	
Dry crop land, owner %	34	32	35	33
Irrigated crop land, owner %	38	33	43	33
Grazing land, acre basis, owner %	41	27	56	30

Table 23 summarizes the cash lease arrangements for dry and irrigated crop land and grazing land. The cash lease rates for operators interviewed by NASS – Montana Office were nearly within the 95% confidence intervals of cash lease rates for owners interviewed for this study. The mean cash payment to the owner was \$26/acre (95% confidence interval between \$24 and \$29/acre) for dry crop land was very similar to the NASS estimate of \$23.50/acre. This study assumed that owner’s paid property taxes and liability insurance expenses. When the owner’s expenses are subtracted from the tenant’s payment, the net cash amount received by the owner is \$24/acre (95% confidence interval between \$21 and \$26/acre).

Table 23 Cash lease arrangement summary for land owners and operators

Land Type	Tenant's Cash Payment to Owner				Net Cash Lease			
	Mean	Lower Bound	Upper Bound	Median	Mean	Lower Bound	Upper Bound	Median
Dry crop land, owner \$/acre	26	24	29	26	24	21	26	25

¹Montana 2013 Agricultural Statistics, 2011-2012 County Estimates, NASS

²Assumes cow-calf pair is 1.3 animal units

The mean cash payment to the owner was \$75/acre (95% confidence interval between \$68 and \$82/acre) for irrigated crop land was somewhat lower than the NASS estimate of \$86/acre. The net cash amount received by the owner is \$10 less, or \$65 per acre (95% confidence interval between \$58 and \$72/acre).

The mean cash payment to the owner of \$8/acre (95% confidence interval between \$7 and \$10/acre) for grazing land was somewhat higher than the NASS estimate of \$6/acre. The net cash amount received by the owner is \$3 less, or \$5/acre (95% confidence interval between \$4 and \$7/acre). The mean cash payment to the owner of \$21/AUM (95% confidence interval between \$17 and \$25/acre) for grazing land was slightly higher than the NASS estimate of \$20.50/AUM. The net cash amount received by the owner is \$18/AUM (95% confidence interval between \$14 and \$22/acre).

In general, this study supports cash lease estimates provided by NASS – Montana Office and added share lease estimates to the discussion. Clearly, cash leases dominate share leases on irrigated and grazing land, and comprise about one-half of the dry crop land leases. As owners become further removed from the land and have less knowledge of farming and ranching practices, cash leases become a more attractive option for many land owners.

The Department of Revenue currently uses a 25/75% share arrangement in their calculation of the share of revenue between the land owner and tenant. This calculation is based on a traditional crop share arrangement of 33/67% with other expenses incurred by the land owner estimated to be approximately 25% of the revenue paid by the tenant to the land owner. When the expenses are deducted from the revenue paid by the tenant, the final crop share effectively represents a 25/75% leasing arrangement between the land owner and tenant. The survey data on leasing rates and landlord expenses obtained in this study are used to evaluate the Department of Revenue assumption that landlord expenses account for 25% of the landowner's crop share. We examine the percentage of expenses in cash leasing arrangements, where we know the total revenue per acre paid by the tenant to the land owner and, except for property taxes, other expenses paid by the land owner. Using 95 percent confidence intervals, for dry crop land, operating expenses paid by the landlord were between 4% and 14% of total cash rent revenues. Similarly, for irrigated crop land, operating expenses paid by the landlord were between 3% and 20% of total cash rent revenues. For grazing land (AUM basis), operating expenses paid by the landlord were between 12% and 16% of total cash rent revenues. However, given the number of missing values in these data, concerns about the accuracy with which landowners reported the operating expense estimates, and the lack of information on property taxes, we would suggest that the Department Revenue continue to use the 25/75% share arrangement in their land valuation formula.

The Department utilizes a 12.5/87.5% crop share split between the landowner and the tenant for summer fallow lands. This calculation assumes that summer fallow land is one-half of the land planted on the parcel of leased land. Based on the dry crop land estimates, operating expenses on fallow land would be between 2% and 7% of total revenue. Given the widespread changes in crop rotations that have taken place over the past fifteen years (associated with air seed, chemical fallow, and other technological innovations), the one-half fallow land assumption should be reviewed; however, given the number of missing values in the survey data obtained in this study and concerns about the accuracy of the operating expense estimates, we would suggest that currently the Department Revenue continue to use the 12.5/87.5% share arrangement in their land valuation formula.

The missing data and accuracy challenges in this study warrant considering other methods of collecting leasing information. Leasing arrangements are typically negotiated legal documents between two parties; hence, there is substantial variability in them. In addition, there were concerns about how knowledgeable land owners were about operating expenses; especially, those not engaged in agriculture for many years and being geographically separated from the farm or ranch. Given these challenges, we would suggest utilizing a more qualitative approach to collecting these data. This approach would require selecting a sample of tenants willing to discuss the terms of their lease agreements in detail. The survey instrument employed would examine the financial contributions of the land owners and tenant. Utilizing this technique, high quality data would be available on revenue and costs.

Limitations

The study provided an important supplement to the NASS – Montana Office results because it interviewed owners, rather than farm and ranch operators. The initial sample included

over 30,000 names and addresses, which needed to be cleaned (elimination of duplicates) and supplemented with telephone numbers. The questionnaire required about 15 minutes to answer; however, the questions on the dollar value of the lease, cattle number and yields were challenging for many respondents to answer. Other important limitations to this study include the following:

- (1) The characteristics of the population of owners weren't known in this study because the list of owners only included names and addresses. Hence, it's unlikely that the results of the study are generalizable to the population of leaseholders in Montana.
- (2) The grazing land data needed substantial editing to clarify whether the respondent was answering per acre or per AUM measurement units. In several cases, both per acre and per AUM information was reported by the respondent enabling the measurement unit to be determined.
- (3) This study interviewed owners, rather than operators. The high percentage of unusable responses was due to owners have limited knowledge of the lease agreement. The grazing leases were especially challenging because respondents were not aware of the number of animal units grazing their land in the past year. Farm and ranch operators, interviewed as a supplement, to this study were very aware of the number of animal units and other expense details. There appears to be an asymmetric information problem, where operators know more than owners, especially as owners age.
- (4) Leasing rates for irrigated crop land had high variances. More information was needed on irrigation methods, especially gravity versus sprinkler irrigation systems.
- (5) This study assumed that all acreage was leased on a parcel basis; however, many leases are whole farm leases. A question should be added to the survey to determine if the whole farm is being leased to a single tenant.

Appendix B – Questionnaire

My name is [INSERT YOUR FIRST AND LASTNAME]. I am calling from the University of Montana in Missoula on behalf of the Montana State University Extension to learn about crop-share and cash leasing arrangements. This will help the State of Montana in its program to support Montana agriculture.

A.1 Is the land you own in Montana or another state?
Montana – A1a
Other State –End Interview

A1a Do you have any crop-share or cash leasing arrangements on your land with any farm or ranch operators? Do you rent land to anyone else for their use with any type of payment or exchange?
yes – go to DC1
no –End Interview

DRY CROP

DC1 How many total acres of dry crop land do you lease to farm or ranch operators?

DC2 (If DC1> 0) How many of those acres are leased for crop share?

DC2A (If DC1 > 0) What was the typical crop-share for dry crop land last year?
_____ % owner DC2B _____ % renter

DC3 (If DC1> 0) How many of those acres are leased for Cash?

DC3A (If DC3 > 0) What is your tenants' typical Cash payment to you per acre for this land (per year)?

DC3A2 Is that before or after expenses?
1=Before 8=DK
2=After 9=Refused

DC3A1 And what was the per acre cost to you for expenses related to this land last year?

IRRIGATED CROP

IC1 How many total acres of irrigated crop land do you lease to farm or ranch operators?

IC2 (If IC1> 0) How many of those acres are leased for crop share?

IC2A (If IC1 > 0) What was the typical crop-share for irrigated crop land last year?
_____ % owner IC2B _____ % renter

IC3 (If IC1> 0) How many of those acres are leased for Cash?

IC3A (If IC3 > 0) What is your tenants' typical Cash payment to you per acre for this land (per year)?

IC3A2 Is that before or after expenses?

1=Before

8=DK

2=After

9=Refused

IC3A1 And what was the per acre cost to you for expenses related to this land last year?

GRAZING

GR1 How many total acres of grazing land do you lease to farm or ranch operators?

GR2 (If GR1 > 0) How many of those acres are leased for a share?

GR2A (If GR1 > 0) What was the typical share for grazing land last year?

_____ % owner GR2B _____ % renter

GR3 (If GR1 > 0) How many of those acres are leased for Cash?

GR3A (If GR3 > 0) What is your tenants' typical Cash payment to you per acre for this land (per year)?

GR3A2 Is that before or after expenses?

1=Before

8=DK

2=After

9=Refused

GR3A1 And what was the per acre cost to you for expenses related to this land last year?

OTHER AGRICULTURAL LEASED LAND

OALL1 How many total acres of OTHER land do you lease to farm or ranch operators?

OALL1_SPEC. What was the specific use for the other agricultural land?

OALL2 (If OALL1 > 0) How many of those acres are leased for crop share?

OALL3 (If OALL1 > 0) Cash?

OALL2A (If OALL1 > 0) What was the typical crop-share for other land last year?

_____ % owner OALL2B _____ % renter

OALL3A (If OALL3 > 0) What is your tenants' typical Cash payment to you per acre for this land?

OALL3A1 And what was the per acre cost to you for expenses related to this land last year?

CS (If DC2 OR IC2 > 0) In your crop-share lease do you typically pay expenses for?

- CS1. Seed? (Y/N)
- CS2 Fertilizer? (Y/N)
- CS3 Pesticides? (Y/N)
- CS4 Custom harvesting? (Y/N)
- CS5 Federal crop insurance? (Y/N)

Section E – CASH LEASE / DRY CROP

Q3 Thinking about the tenant renting the dry crop land acres from you on a cash rental or lease arrangement that generates the most revenue, in which county or counties is this property located?

_____ county (counties)

C4 Thinking about the dry crop land field rented to this tenant with a cash lease, what crop was grown on this land in 2013?

_____ crop

Q5 How many acres are in this field?

_____ acres

C6 What was the yield per acre for the MAIN crop grown on this land in 2013?

C6. _____ bushels per acre C6a. _____ Crop type

C7 What type of crop rotation is used on this dry crop land?

1=continuous crop,

2=Crop-fallow, where one-half of the land is fallowed each year

Other, please explain[C7.a]_____

Q8 For this parcel in 2013, what was the renter's payment to you per acre? (subtract any lease payment from renter to you specifically for houses, buildings, or improvements) ?

Q8. \$ _____ Q8_unit. unit measure _____

Q8a. Did you include any deductions in that number you just gave me, such as for fencing, seed, taxes, or any other expenses?

1=Yes GO TO Q8B

0=No GO TO CL9

Q8b. How much did you deduct? What was dollar amount of that deduction?

CL9 Is the cash lease a fixed amount, or is it flexible, based on the yield or price?

1=Fixed amount

2=Flexible, based on the yield

3=Flexible, based on crop price

4=Flexible, based on both yield and price

5=Something else?[CL9A]_____

CL10. We are interested in how you are involved in your cash arrangement. Did you have any farm operating expenses deducted from your cash payment in 2013?

1=Yes

0=No

CL11 How much did you **pay per acre** for [insert item] for this particular tenant:

CL11.a Seed	_____	\$/acre
CL11.b Fertilizer	_____	\$/acre
CL11.c Pesticides	_____	\$/acre
CL11.d Custom harvesting paid	_____	\$/acre
CL11.e Federal crop insurance	_____	\$/acre
CL11.f Hail insurance	_____	\$/acre
